EMULATE3D

by ROCKWELL AUTOMATION

Creating the Future of

INDUSTRIAL OPERATIONS

FMI, Cosimulation, and Controls Testing

Roger Kassouf

Emulate3D Applications Team Lead

Ethan Laib

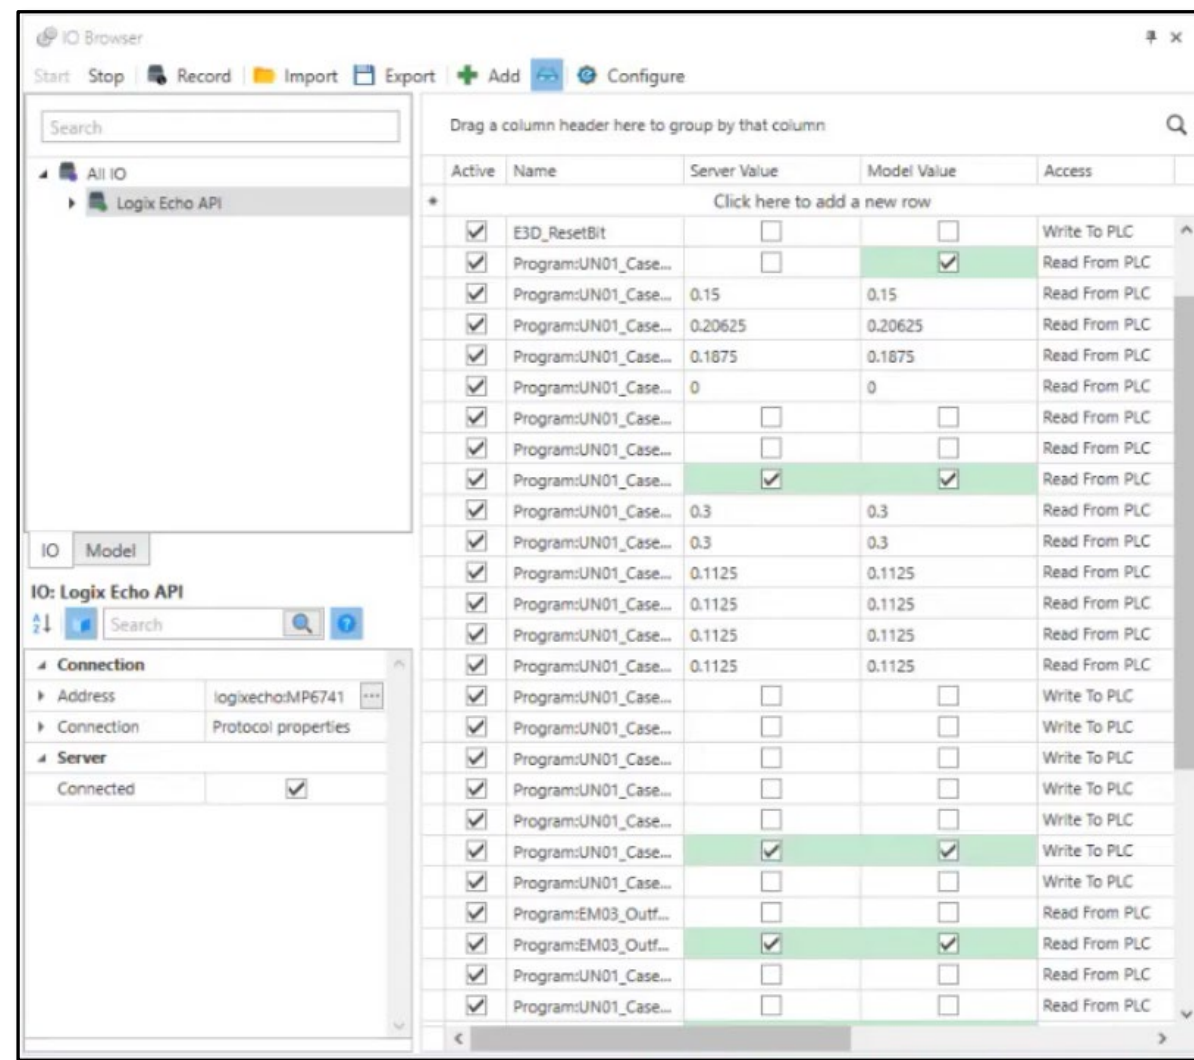

Emulate3D Applications Consultant

Co-simulation Enhancements

- Rework of co-simulation engine, separating out the co-simulation master from Emulate3D
- Performance and stability benefits for all existing co-simulations, including:
 - Logix Echo
 - PLCSIM Advanced
 - SIMIT
 - Robot co-simulation
- Future potential for use in Multi Model simulations!
- Laid the groundwork for FMI

New PLCSIM Advanced Protocol

(Available now in public preview)

Brand new PLCSIM Advanced implementation using Siemen's updated runtime API.
Separate protocol to ensure continued support of older projects and PLCSIM Advanced versions.

The two completely different protocols have these main differences:

Protocol	PLCSIM Advanced (legacy)	PLCSIM Advanced S7-PSA (new)
Version Support	All versions, including v5 and before	Only supports v6/v7 + (released Dec 2024)
Performance	Good	Greater
Maximum Scale	Good	Greater
Access	Tag Access or Memory Access	Tag Access only
UDTs and Arrays	Parsed as symbol branches only	Implicit support for UDTs & Arrays
Co-simulation	Synchronization at cycle control point	Customizable synchronization points
Program Updates	Must disconnect before downloading	Stay connected during download
Remote connection	Single remote connection	Multiple remote connections

PLCSIM Advanced S7-PSA

Tag Access

Memory access is no longer recommended by Siemens

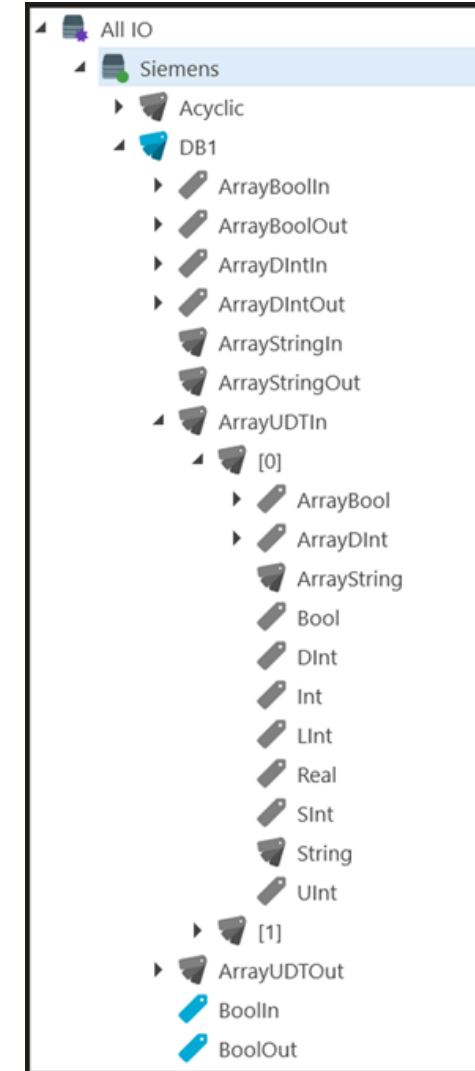

The new protocol only offers tag access

This new protocol allows the following advantages:

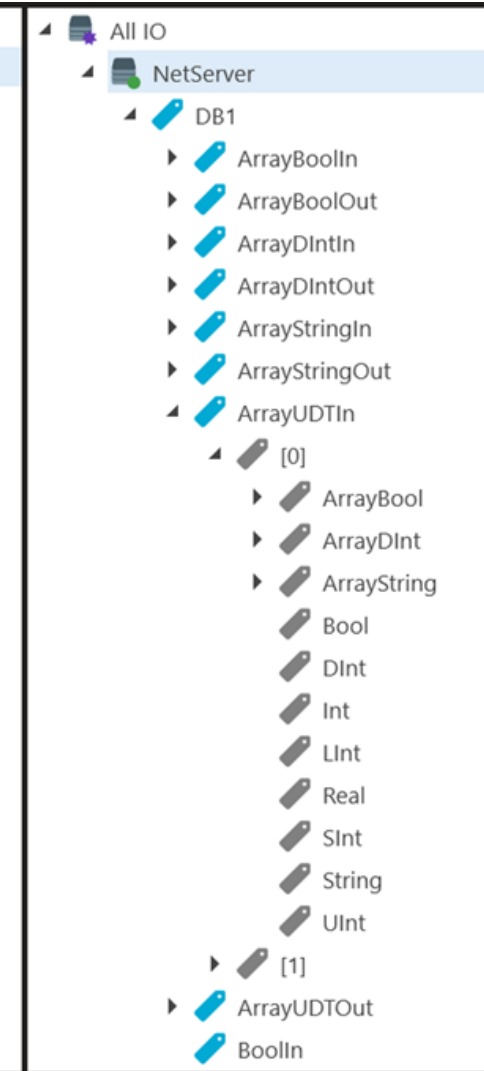

- Improved batching of IO requests, for faster data exchange
- Removed risk of writing to unintentional areas of storage
- Implicit support of UDT structs, arrays, and strings
- Resolved potential issues with writing to safety tags
- Selective filtering of tags, mitigating the 500,000 entries limit

Tag List	
DataBlockFilterList	
IsHMIVisibleOnly	<input type="checkbox"/>
TagListDetails	IOMCTDB
CT	<input checked="" type="checkbox"/>
DB	<input checked="" type="checkbox"/>
IO	<input checked="" type="checkbox"/>
M	<input checked="" type="checkbox"/>

Legacy UDT

New UDTs

| PLCSIM Advanced S7-PSA

The new API provides us with new options, allowing the following in Emulate3D:

Remote Connections

- Connect a single Emulate3D model to multiple remote instances of PLCSIM Advanced
- A preview tester successfully connected Emulate3D to five PLCs using the new protocol

Live Tag Configuration

- Stay safely connected during downloads using the new protocol
- The old protocol provided no notifications, and risked crashes

Co-Simulation

- Define synchronization points at which the instance freezes simulation and signals to Emulate3D that it's ready to exchange tag data
- Previously, co-simulation freeze & data exchange would occur at the cycle control point

This protocol will become the default in the future

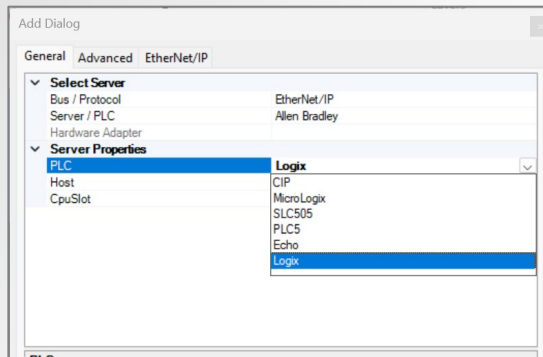

Logix Tag Server

Improvements to connectivity with Allen-Bradley PLCs and Rockwell software.

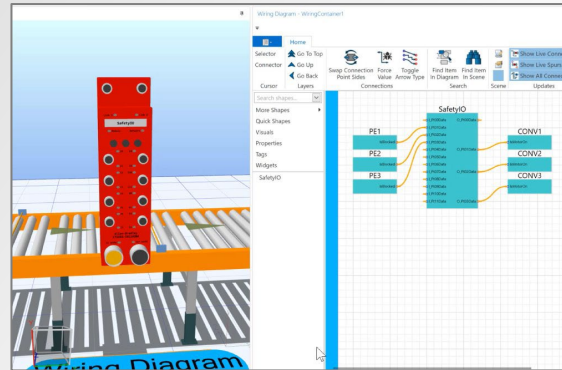

New Logix Server Type

- New server type encompasses CIP Class 1, CIP Class 3, and Logix Echo API
- Users can then choose the protocol at any time in the Tag Sever and Tag settings

Module Emulators

- Module emulators are now supported by CIP Class 3 and Echo API in addition to the previously supported CIP Class 1
- Internal logic of the device is emulated for all Logix protocols

Overall Improvements

Many improvements, including:

- Improved tag merging optimizations for the Logix Echo API connection
- Faster connection establishment speed for complex IO trees
- Clearer configuration of co-simulation step
- Configuration of continuous task fidelity, allowing for faster co-simulations

Additional Data type support for Logix (and for Omron), including:

- Strings from an array of strings
- Strings in a UDT
- A UDT which is composed of strings and array string tags

| LS Electric, Omron, and other protocols

Emulate3D remains controller agnostic, connecting to far more than just Allen-Bradley

- Support coming in version 18.0.2
- Ability to connect with hardware
- Full co-simulation with XGSIM

- Faster connection speed for NX, NJ, and CJ series controllers
- Additional data type support
- Plans for Omron co-simulation with Sysmac Studio Simulator

Our team is targeting to support more controller connections, including Keyence and CODESYS

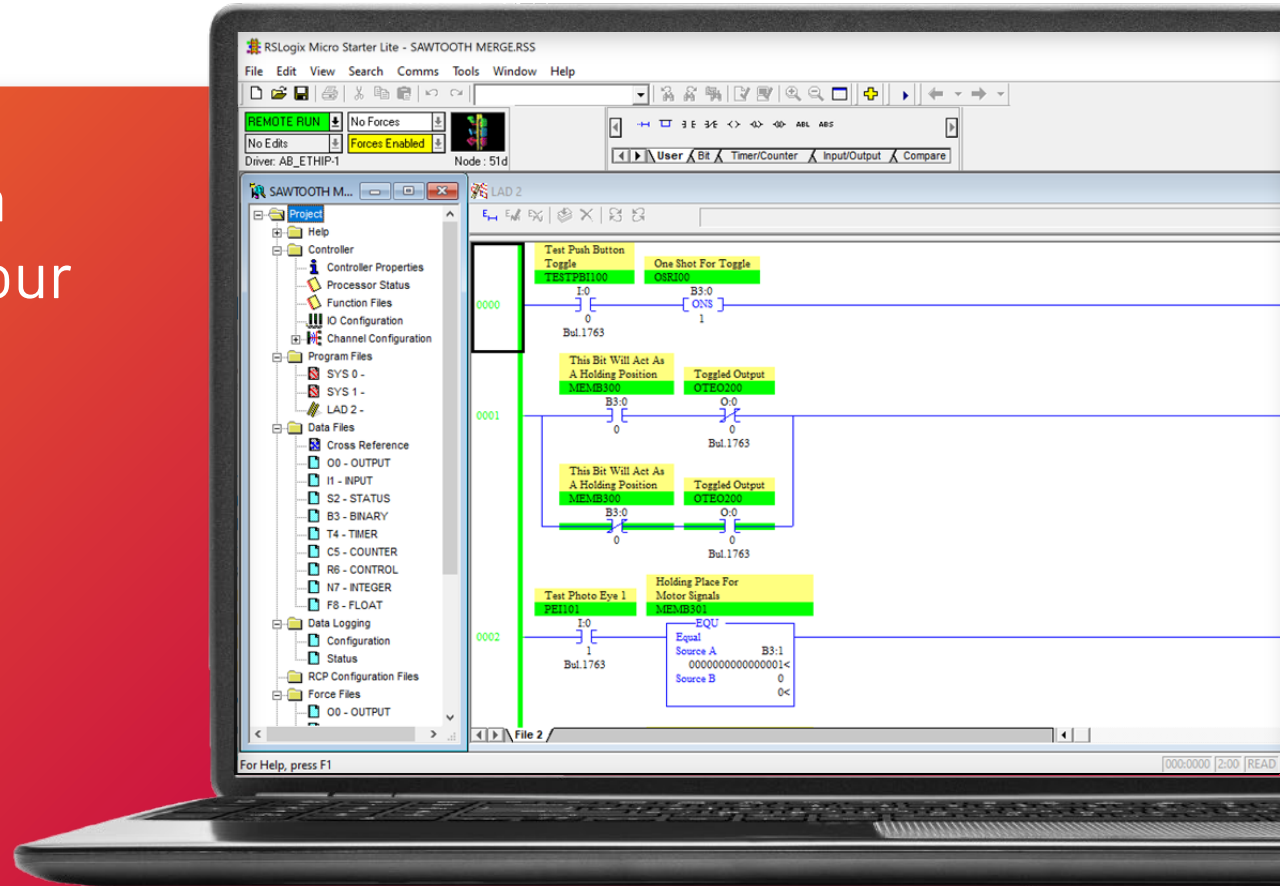

MicroLogix 1100 Emulator

A successor to the Emulate3D internal Ladder Logix Editor

Use the MicroLogix 1100 Emulator a **free, fully contained** SoftPLC for your Emulate3D projects and demos

- Program PLC projects for free using RSLogix Micro Starter Light
- Easily add the controller your model through the catalog
- Co-simulation support for time synchronization

| What's coming for Emulation?

UDT Configuration Wizard

- No need for scripting
- Define UDTs via a user interface
- Similar to how the Telegrams interface to make Higher level Emulation easier

Controls Testing Advisor

- Looks for tags and bindings that could be made simpler
- Advises on data types to use, scan intervals, tag merging, etc.

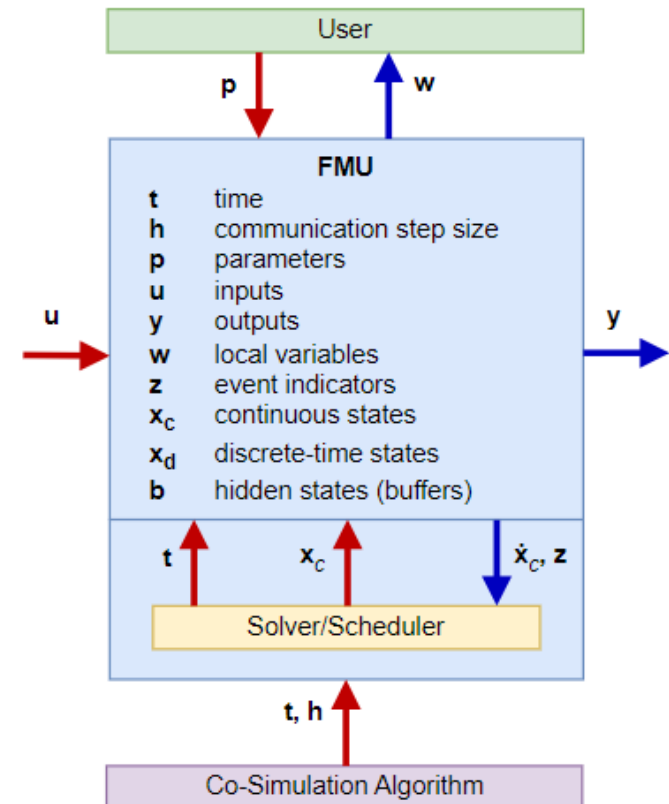

Controls Testing Profiler

- Looks at IO queue lengths
- Reports on round trip times
- Advises on things CT Speed related

| What is FMI?

- The Functional Mockup Interface (FMI) is an open standard for exchanging dynamical simulation models between different tools in a standardized format
- This standard format is called a Functional Mockup Unit, also known as an FMU
- Maintained by the Modelica Association through a steering committee with membership across various companies

| Why support FMI in Emulate3D?

Multi-Physics

High fidelity modelling for:

- Mechatronics
- Web Handling
- Thermodynamics
- Chemical Processes

...and many more!

Single Interface

Single connection for:

- MATLAB/Simulink
- MapleSim
- Ansys

...and many more!

Scalable co-simulation

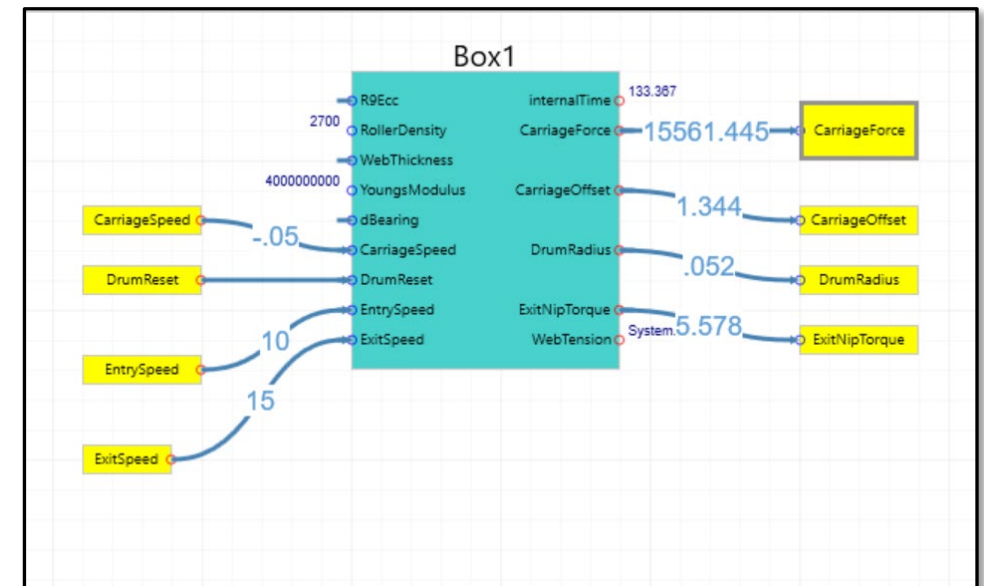

Emulate3D is the co-sim master:

- Allows clock synchronization with multiple FMUs and other co-simulators (Logix Echo, PLCSIM Advanced)
- Run faster/slower than real-time
- Future – FMI for Multi-Model

| What have we done?

- Major overhaul of the co-simulation framework
- Full support of imported v2 & v3 co-simulation FMUs
- Treated the same as co-simulations, like Logix Echo, PLCSIM Advanced, and SIMIT RCI
- Compatible with the wiring diagram
- Scripting support via API, including full co-simulation control for advanced cases

| Using the FMI Standard

Use a wide range of simulation tools to model systems in high fidelity

The typical FMI approach follows these stages:

- A modelling environment describes a system through equations
- Generate and export the component in an FMU in the tool
- Import the FMU in another environment to execute

Follow this process to import models into Emulate3D from a growing list of over 200 tools including:

- Matlab/Simulink
- Ansys
- MapleSim

Export your model as a Functional Mock-up Unit:

Import the Functional Mock-up Unit to Emulate3D:

FMU Export

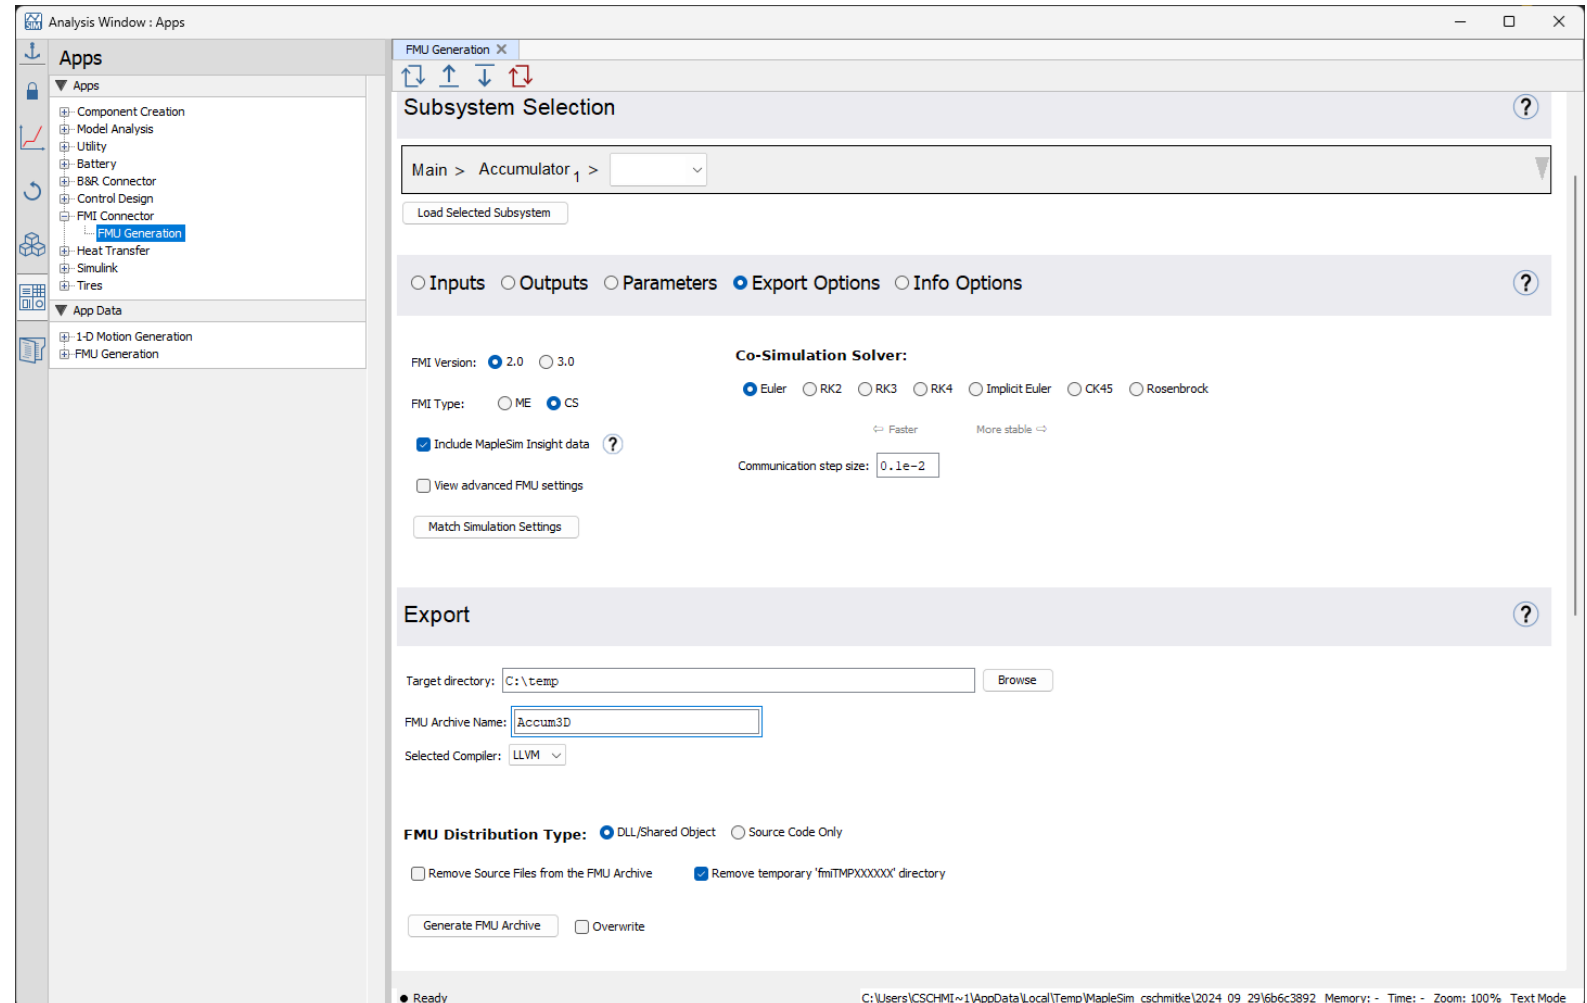

Export a cosimulation ready Functional Mock-up Unit

FMU contains:

- Variable definitions
- Equations used by the model
- Additional optional data

The importing tool:

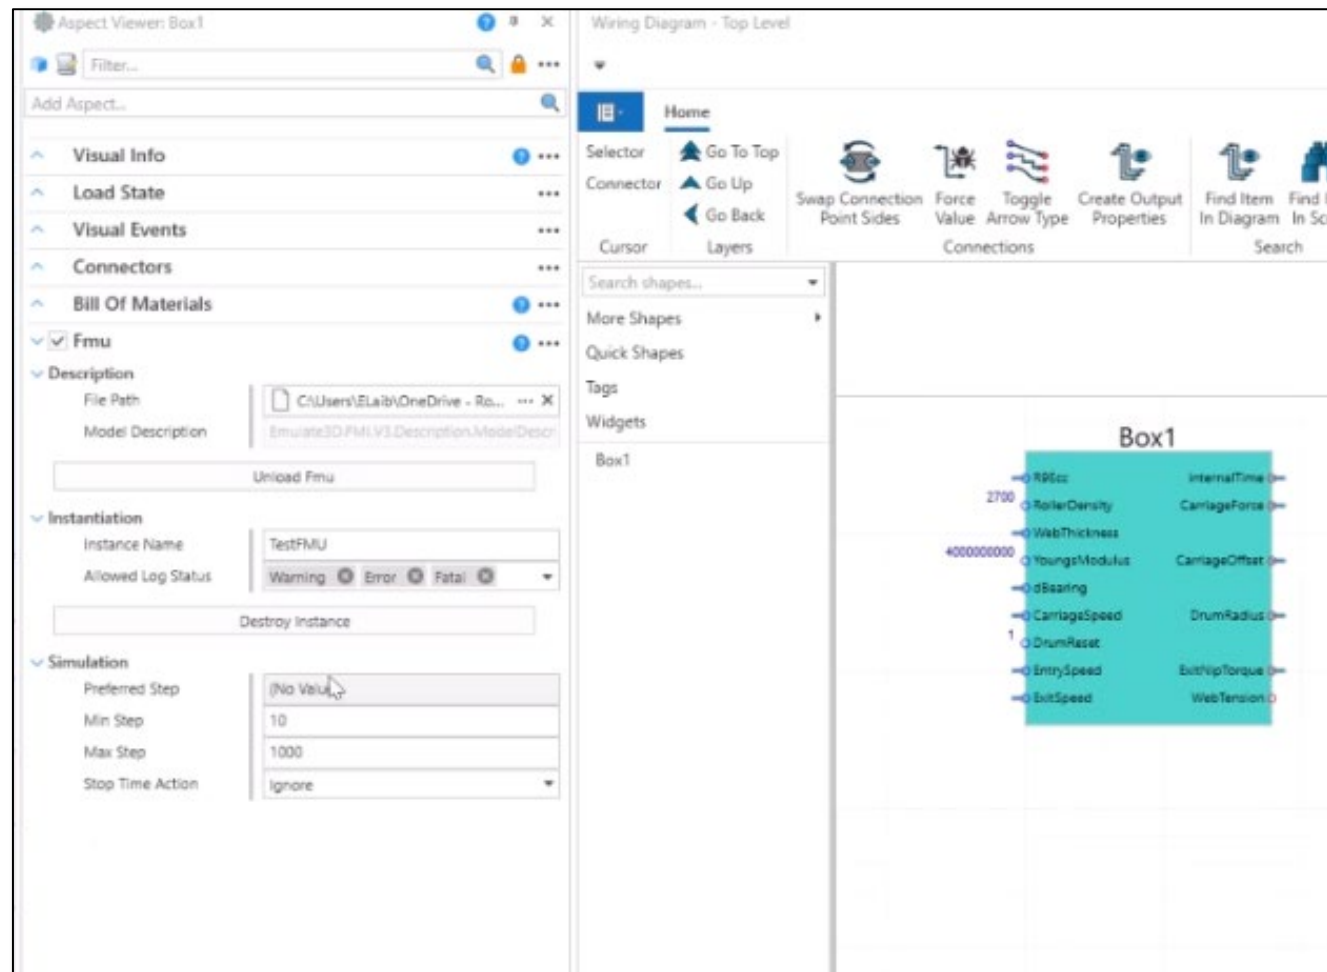

- Sets the FMU inputs
- Asks the FMU to step forward
- Runs internal solvers
- The FMU updates its outputs

RA | FMI Import and Configuration in Emulate3D

Think of an FMU like a Black Box:

- Import FMUs to any visual using an aspect.
(A motor, a mixer, a robot, a box...)
- See input and output properties for the FMU
- Use these in QuickLogic, in Scripting, or bind to properties and PLC tags with the Wiring Diagram.
- The model and FMU advance together according to the step size, reading inputs and updating outputs

| Bringing Vacuum Carburizing to Emulate3D™

What is Vacuum Carburizing:

- The process of diffusing carbon into iron or steel to make it harder
- Requires complex systems due to the number of processes involved in maintaining vacuum pressure

The Challenge:

- Systems are large and difficult to test
- Stops client's production
- Requires short timelines

EMULATE3D

by ROCKWELL AUTOMATION

FMU Import - Vacuum Carburizing Application

Bringing Web Handling Management to Emulate3D™

THE CHALLENGE

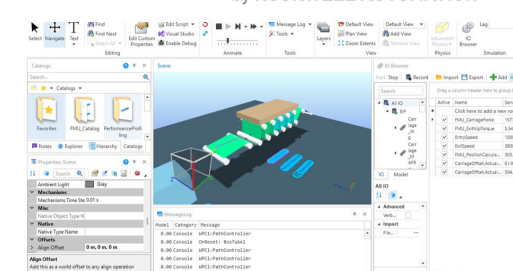

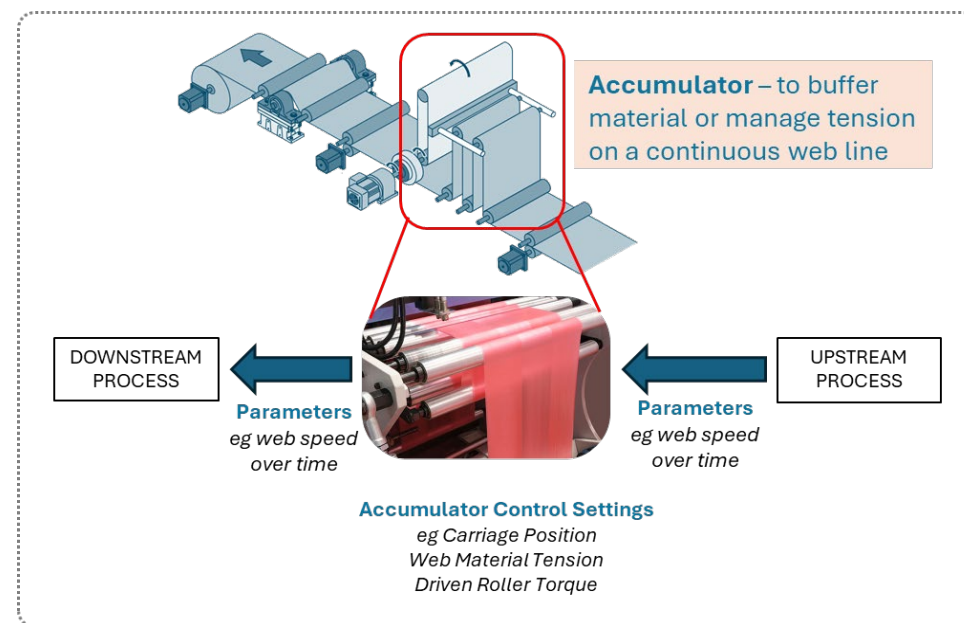

Materials passing through web handling and converting processes:

- Have complex dynamics and tension fluctuations
- Are affected by UPSTREAM processes
- Impact DOWNSTREAM steps

THE SOLUTION

MapleSim™ models of web handling systems can:

- Capture web handling process dynamics
- Visualize tension and torque over time
- Integrate with Emulate3D™ via FMI to provide enhanced line simulations

USE SIMULATION TO **MAINTAIN PRODUCT QUALITY** AND **AVOID DOWNTIME** WHEN MAKING CONTROL AND MACHINE CHANGES

MapleSim_Demo_VelocityBased_DemoWD_V0.4* - Emulate3D 2025 (Dev) [Expires 12/30/2024 10:59:59 PM]

FMU Import - Web Handling Application

EMULATE3D
by ROCKWELL AUTOMATION

RA | Tip – Connect an FMU to another FMU

In Emulate3D, FMUs can be linked together to create larger models

- Connect the FMUs using the wiring diagram
- Create larger, higher fidelity systems

| This is just the beginning

FMI can be used to bring in high fidelity simulations across many applications

Pharmaceutical

Bioreactors and Cleanroom
HVAC systems

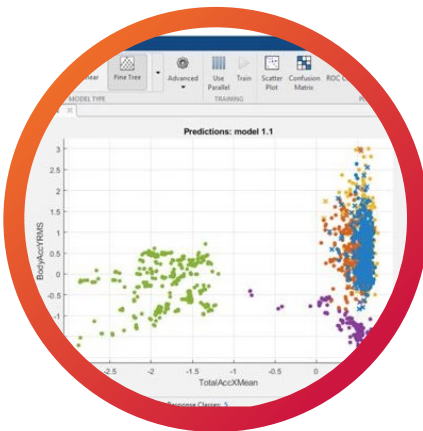

Data Centers

Thermodynamics for
temperature control

Advanced Analytics

Use analytics toolboxes to
gain insights on your model

Chemical and Fluid systems

Higher fidelity pumping
stations and mixing tanks

Electrical and Power Systems

Battery systems or devices

What is Device Emulation?

There are two parts to Device Emulation:

1. **Device Network Emulation** emulates the low level **CIP Class 1 communication** with the PLC. This layer of emulation is only enough to establish data communication with the PLC, exchanging uninterpreted data.
2. **Module Emulation** emulates the logic inside the device/module. This might include any CIP Class 3 Objects that the module supports, and any Smart logic that it offers.

Why Device Emulation within Emulate3D?

No PLC Code Changes

Don't need to Inhibit Allen-Bradley Modules

Communicate via CIP Class 1 with supported devices using Device Network Emulation layer

Enables automated testing of your controls code and CI/CD workflows

Write to Safety IO

E3D creates the CIP Class 1 connection on the specified IP

The PLC thinks it's talking with the real hardware module, and Status bits are satisfied

IO can be freely exchanged (Logix Firmware 35+)

Comprehensive Testing

Module configuration errors can be discovered & resolved

With Module Emulators, internal logic is emulated with highly accurate behavior

Fault testing can be performed virtually

What Module Emulators are available?

AB Digital I/O Modules

AB Velocity Drives
(standard)

Armor PowerFlex

Allen-Bradley Module Emulators Catalog

Add the catalog item into the model to automatically generate the module emulation logic

Highly parametric with many configurations modelled

Single binding in IO browser

Easily bind inputs and outputs to E3D properties via IO Browser, Wiring Diagram or scripting

Allen-Bradley Velocity Drives Catalog (in-progress improvements)

IO Browser bindings automatically generated

The screenshot displays the Allen-Bradley Velocity Drives software interface, which is divided into several panels:

- Controller Organizer:** Located on the left, it shows a hierarchical tree of components. The 'I/O Configuration' section is expanded, showing the '1756-L84ES ABVelocityDrives' module. The 'Module Defined Tags' section is also visible, showing tags for 'PF525_1:I' and 'PF525_1:O'.
- Controller Tags:** A table in the center-left lists the tags for the 'ABVelocityDrives(controller)' module. The table has columns for 'Name' and 'Value'. The tags are organized into a tree structure, with 'PF525_1:I' and 'PF525_1:O' being the primary categories.
- IO Browser:** A table on the right side of the interface, titled 'IO Browser', which lists the IO modules and their properties. The table has columns for 'Active', 'Name', 'Server Value', 'Access', 'Visual', 'Property', 'Expression', and 'Protocol'. The 'All IO' section is expanded, showing the 'Advanced' tab.
- 3D Model:** A 3D visualization of a conveyor system is shown in the center-right. The conveyor has a yellow box on it, and the system is supported by a metal frame. The model is rendered in a 3D perspective view.
- Message Log:** A panel at the bottom right shows the 'Message Log' with columns for 'Model', 'Category', and 'Message'.

The status bar at the bottom of the window indicates 'Ready' and 'Communication Software: FactoryTalk Linx'. The bottom right corner of the window shows 'Automation, Inc.' and the page number '29'.
